Journées LPWAN, 8-9 July 2021, Clermont-Ferrand

# OUTLINE

01

# INTRODUCTION

# INTRODUCTION

It is estimated that more than 20% of IoT connections are made via LPWAN (NB-IoT, Sigfox, LTE-M, ...)

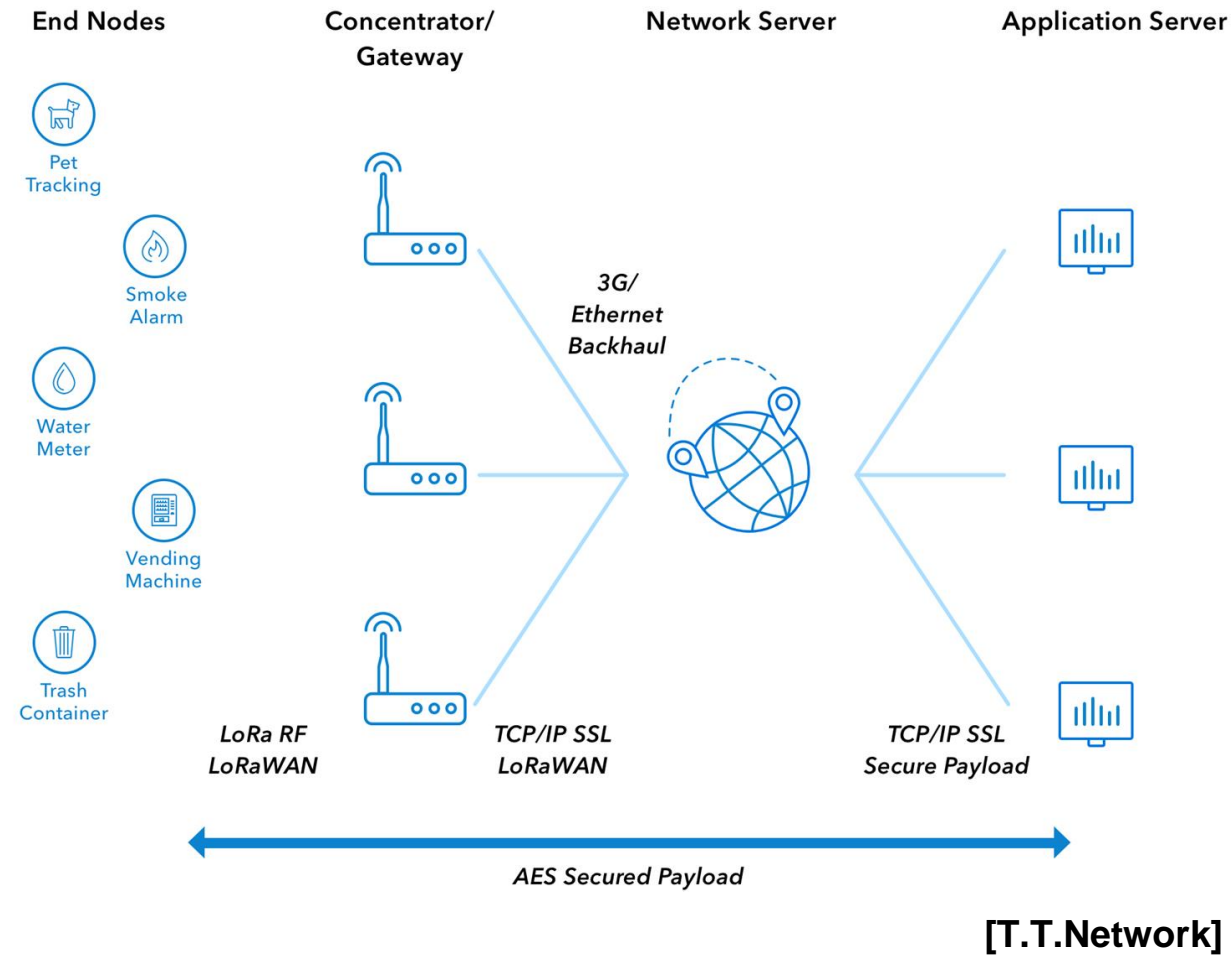

LoRaWAN has raised much attention in wireless communications communities due to its high promises

Long-range connectivity, low power, low data-rate, and low-cost end-devices

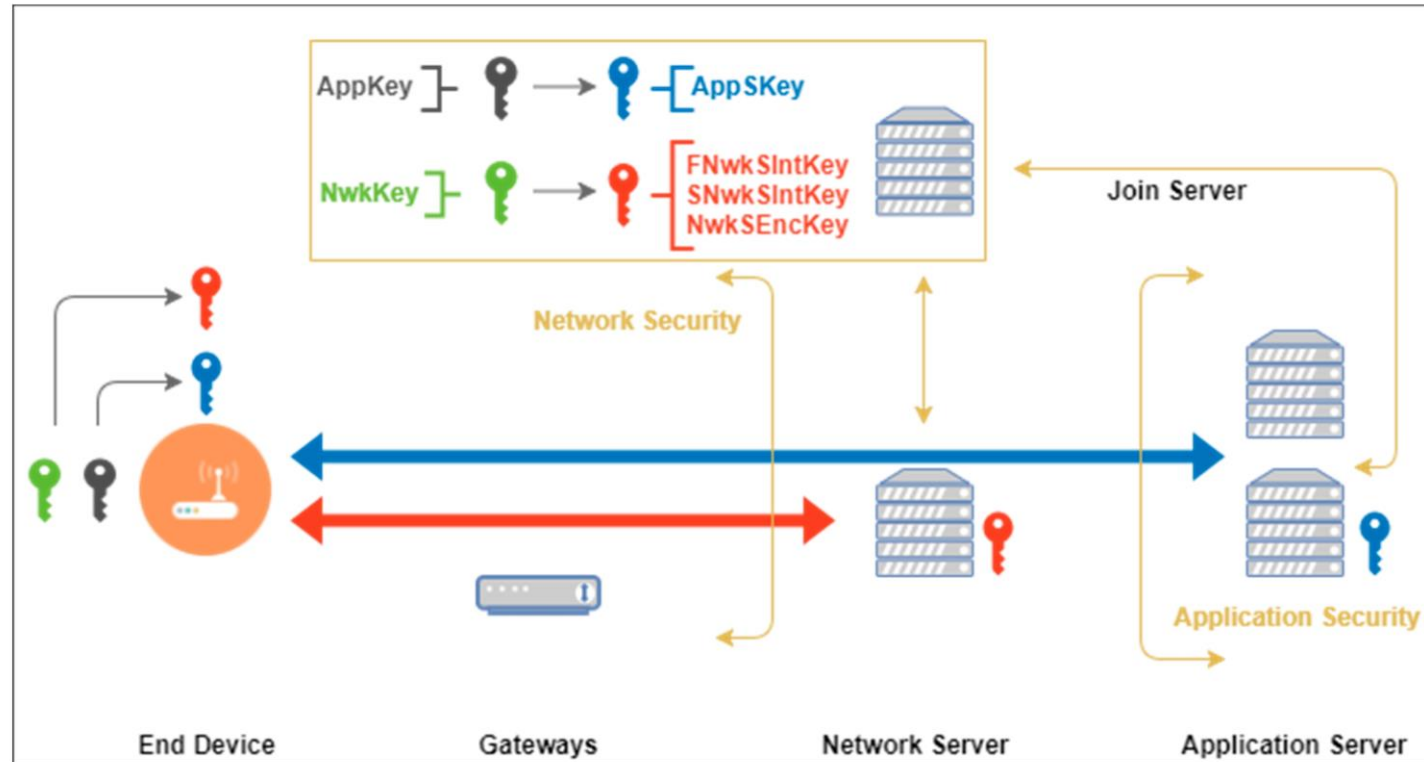

# 02

## LoRaWAN: Overview

# LoRaWAN Architecture

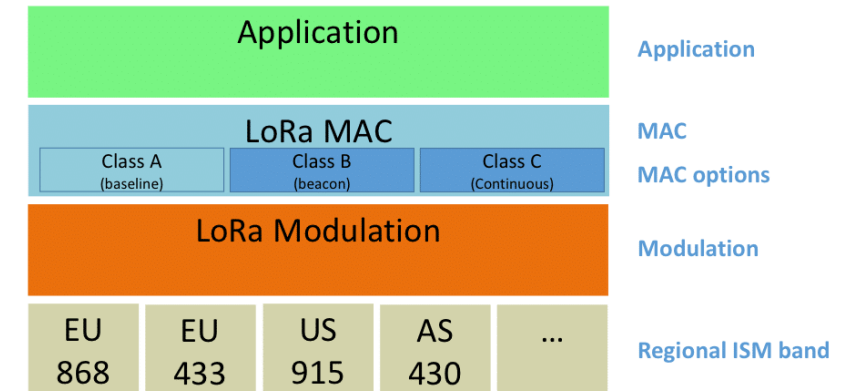

# LoRaWAN Security

- OTTA Activation.
- LoRAWAN Spec 1.1

## Roaming Methods :

- Passive Roaming (spec 1.0.x)
- Handover Roaming (spec 1.1)

03

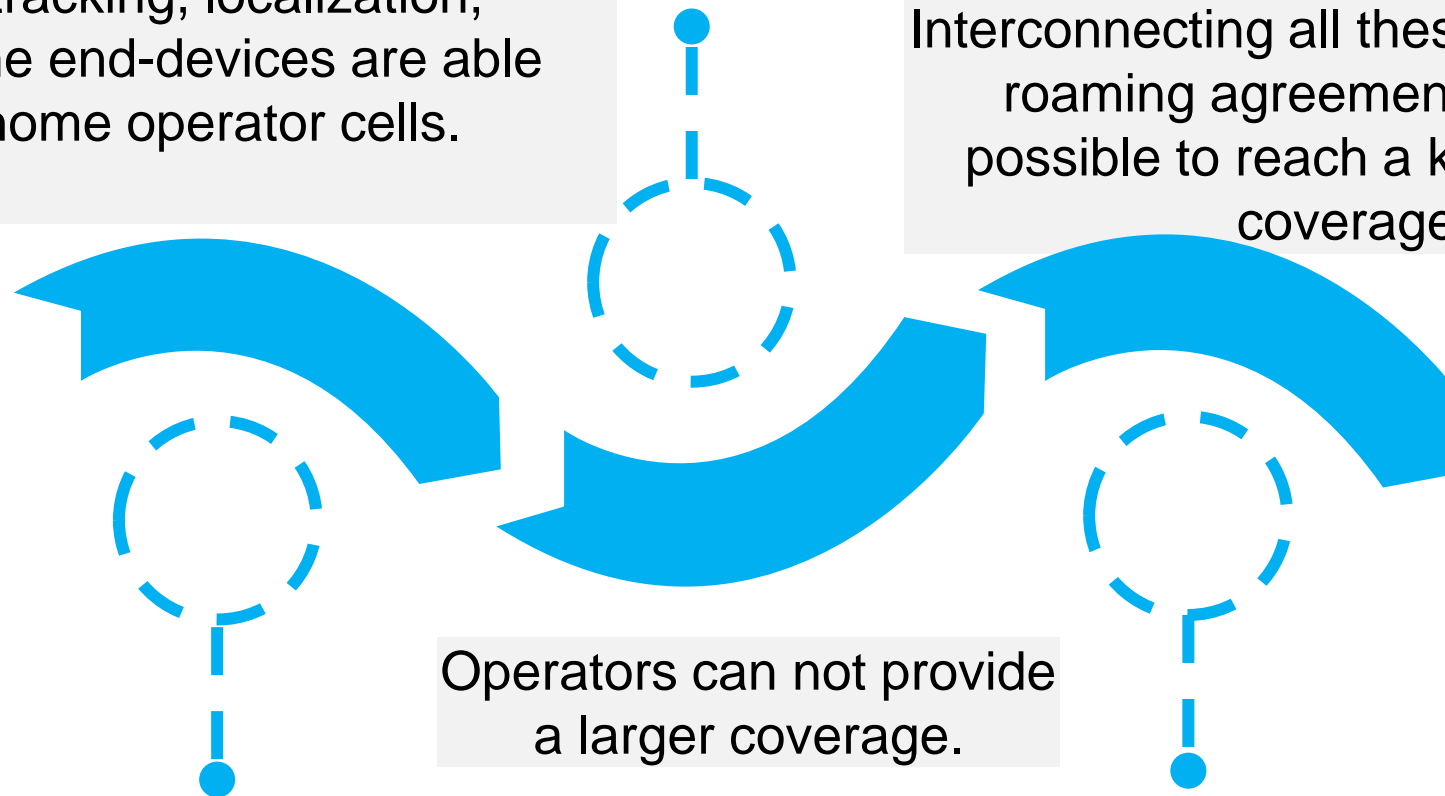

# Problem Statement

## Problem Assessment

For a set of applications like smart logistics tracking, localization, and monitoring, the end-devices are able to leave their home operator cells.

Interconnecting all these networks via roaming agreements makes it possible to reach a kind of global coverage

## Problem Assessment

**Unifying networks by enabling LoRaWAN roaming requires the ability :**

1- To Check if the operator requests roaming for the end-device.

2- To find out the home network of the mobile end-device.

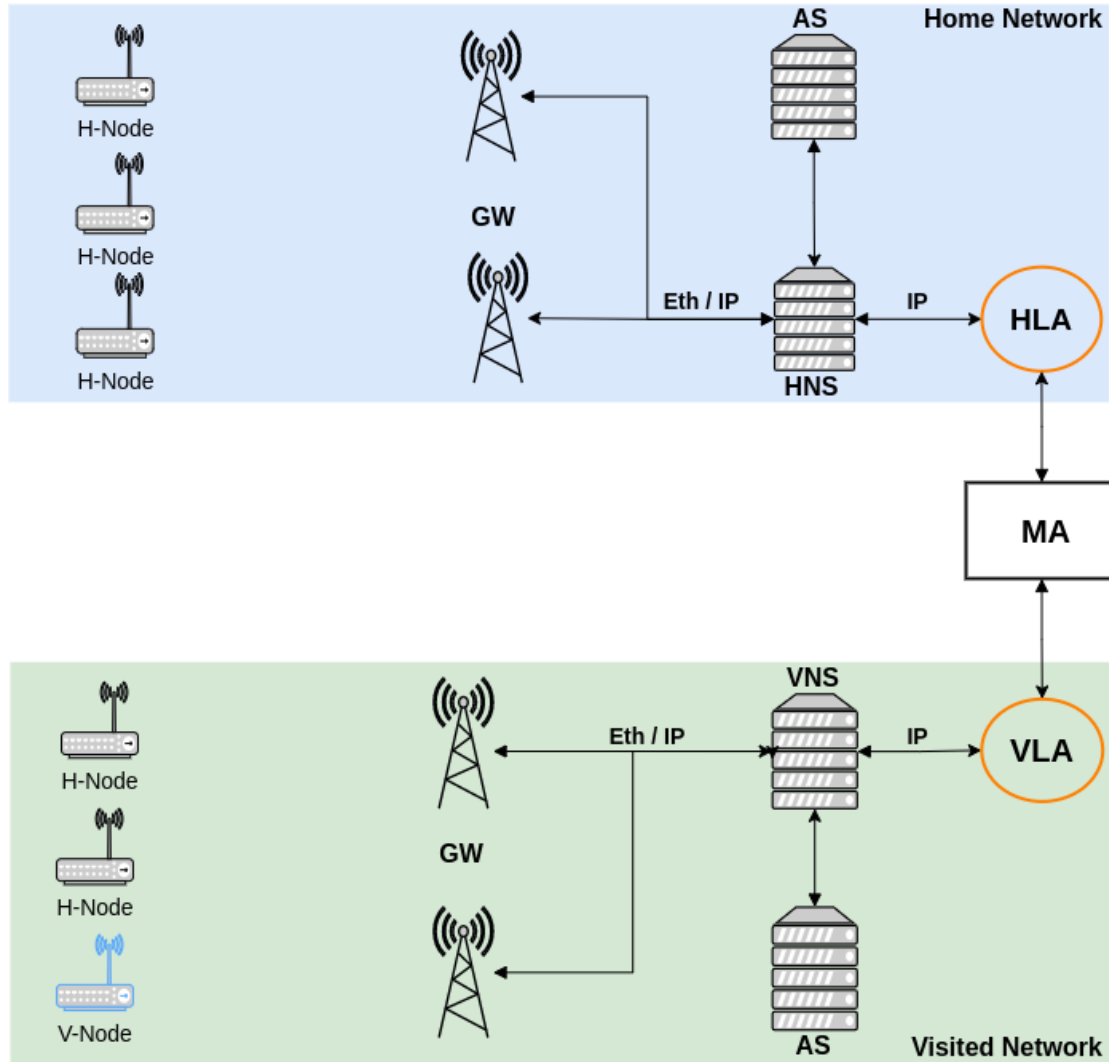

3- To retrieve the end-device keys context.

04

# Contributions

# LoRaWAN extended Architecture

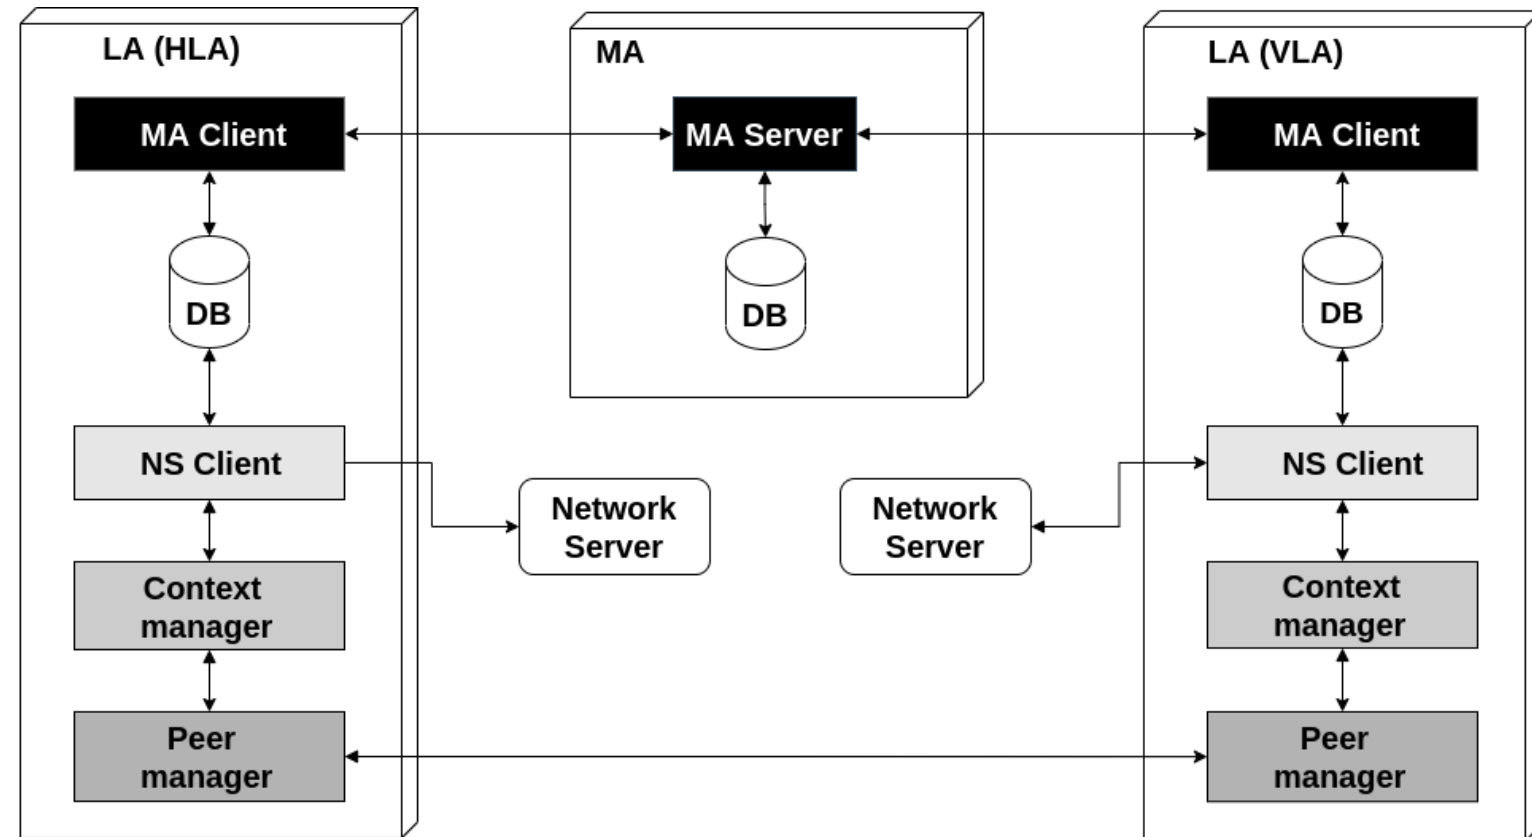

MA: Master Agent.

HLA: Home Local Agent.

VLA: Visited Local Agent.

# LoRaWAN extended Architecture

- **MA:**
  - Net-ID generation.
  - DNS Resolution.
- **VLA/HLA:**
  - JoinRequest Handling,
  - Context Retrieval and Storage,
  - Network Server Communication, ...

# Network Subscription and Node Provisioning

## 1. Network Subscription

## 2. Node Provisioning

Field	MHD	MacPayload	MIC
Size (Byte)	1	18	4

Field	MType	RFU	Major
bit	7..5	4..2	1..0

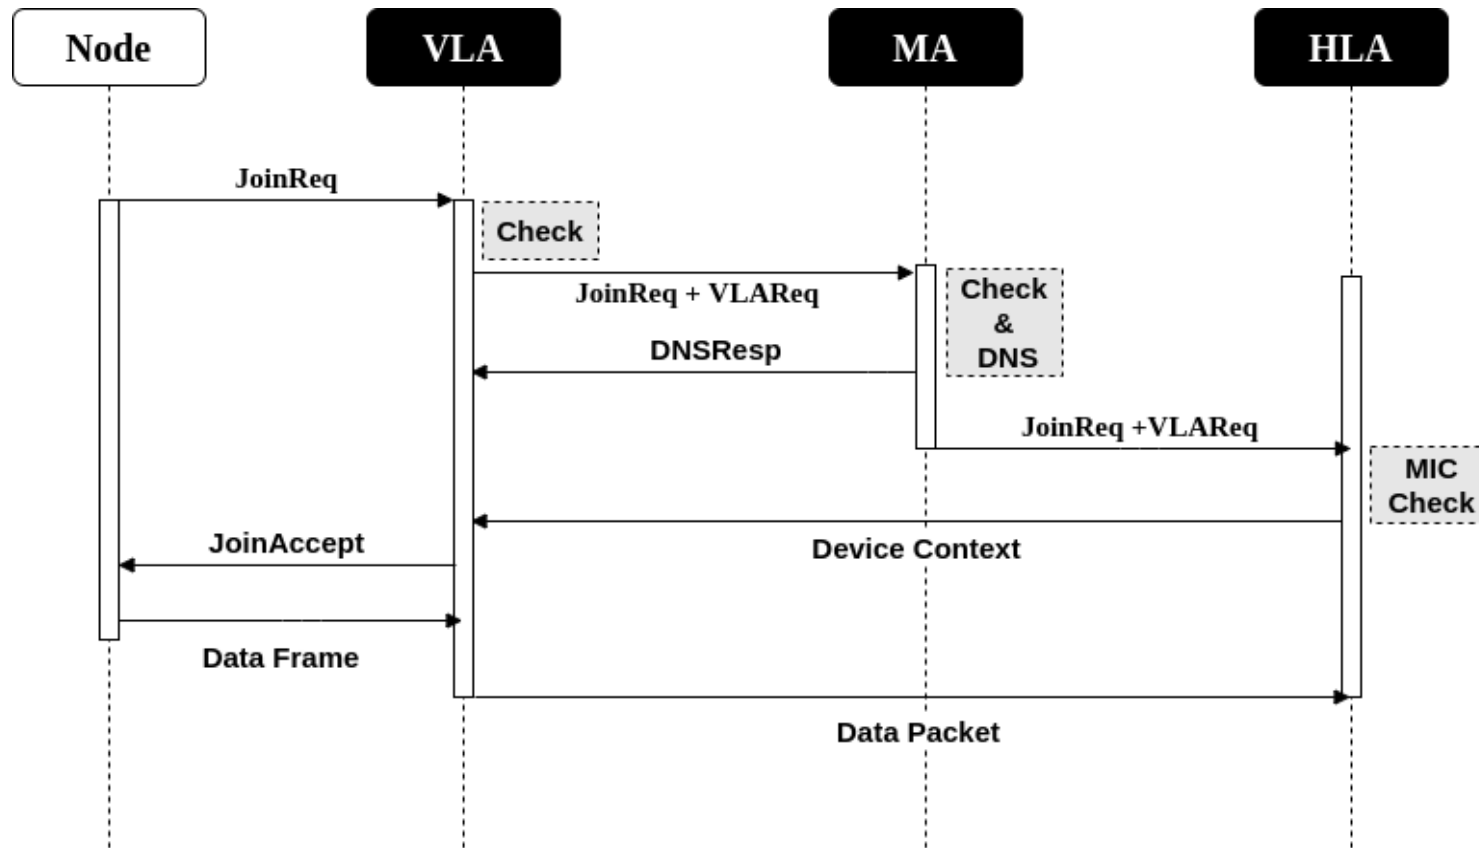

Field	JoinEUI	DevEUI	DevNonce
Size (Byte)	8	8	2

JoinEUI

Field	Net-ID	uuid
Size (byte)	4	4

- JoinEUI: a global applicationID in IEEE EUI64 address space.
- JoinEUI based Net-ID generation.  
JoinEUI = Net-ID | uuid.
- Example : 4C683808E77E4E01

# LoRaWAN Roaming Protocol

- **JoinReq:** JoinEUI | DevEUI | DevNonce.
- **VLAReq:** VNS ip@ | VNS Domaine Name.
- **DNSResp:** HNS ip@ | HNS Domaine Name.
- **Device Context:** Authentication Root Keys, Frame Counters.

# Implementation and Validation

Network	Net-ID	Ip @	Domaine Name
hNS ENSEEIHT	4C683808	Ip @	Hns.com
vNS IRIT-UPS	CBEF7B6E	Ip @	Vns.com

# Implementation and Validation

## Nodes:

Pycom Lopy 4

Microchip RN2483

## Gateway:

Mikrotik

Node	DevEUI	JoinEUI
Lopy4-1	BEEFDEADBEEF0001	4C683808E77E4E01
Lopy4-2	BEEFDEADBEEF0002	4C683808A9713E0
Lopy4-3	BEEFDEADBEEF0003	4C683808C6768E03
Lopy4-4	BEEFDEADBEEF0004	4C683808E27DCE04
Lopy4-5	BEEFDEADBEEF0005	4C683808B09E5E05
Lopy4-6	BEEFDEADBEEF0006	4C6838081F73E060

# Implementation and Validation

The cumulative distribution function of the duration (T) needed for DNS resolution and context migration from the hNS to the vNS measured through multiple OTAA activations.

04

# Conclusions

## Conclusions

1. We investigated the inter-operator roaming capability based on DNS resolution and end-device contextmigration.
2. Proposed an extension to the LoRaWAN architecture.
3. The results of the experimental analysis suggest that the proposed mechanisms do not generate significant latency.

# QUESTIONS?
